

## Graphical Interface

Currently the mining companies have their equipment operating information stored as physical documents; this means that in the event of emergency accessing this information will take time, risking additional costs and a lack of productivity for the organization.

**eView** is a robust and reliable solution specifically designed to fully meet these requirements:

### Solution - **eView** :

**eView** was created to allow users to select and access documents related to plant equipment, directly from a graphical interface that displays relevant equipment.

The solution details important areas of the plant, such as floor sections, panels, equipment, and other critical items. The graphical interface allows users to quickly identify the required item and access the related documentation immediately.

With a quick click of the mouse the user has immediate access to all related information (manuals, reports, blueprints, plans, etc).

## Benefits:

- An easy way to find information on the equipment since users are familiar with plant images, with a simple click they receive direct access to the relevant specifications.
- Time is saved that would typically be spent searching for the desired information.
- Accessibility from anywhere in the organization.
- The quick searching capability allows the user to perform additional research within moments, quickly identifying previous issues.
- Information Security.
- Ability to promptly respond to requests from personnel and supervisors.
